

Start here — what this measures

Three questions, one after the other. Every number below is a count, except where marked.

1 · HOW MANY USE IT?

Of the people holding a seat, how many ever use Copilot, and how many have built a habit — see Definitions below.

A count. No assumptions.

2 · HOW DEEPLY?

What share of interactions delegate real work — agent, CLI, plan and app surfaces — rather than accepting a suggestion.

The delegation rate. Also a count.

3 · WHAT IS IT WORTH?

People whose own delegation rate clears the bar are deep users. They produce measurably more.

Deep users × uplift = capacity, in FTE.

THE FOUR SURFACES read live from the model

Total		2,651,527

THE ONE MEASURE

Where the line sits

Suggest and **Edit** — Copilot proposes, the developer decides. Below the line.

Review and **Delegate** — a whole task is handed over. Above the line.

The delegation rate is simply the second group divided by all four. A weighted version was tested and dropped: it tracked the plain count almost exactly and barely moved the ranking, so it added apparatus without adding insight.

THE ONE ASSUMPTION

ONE assumption: deep users are 18.4% more PRs merged per week than matched peers, valued at \$150,000 per FTE per year. Everything else is counted. Change either value in the config table and every figure follows.

DEFINITIONS

Delegation rate = interactions in agent, CLI, plan and app surfaces, divided by all interactions. Deep user = personal delegation rate above 10%. Habitual = active in 3 of the last 4 weeks. All three are counts.

🔄 Widely deployed. Not yet used deeply.

One funnel: licensed → active → habitual → deep. Reach asks how far people get, Depth how many reach the last stage, Value what that stage is worth.

DELEGATED = handing over a whole task — agent, CLI, plan or app — rather than accepting a suggestion.

● Never used ● Active, not habitual ● Habitual, not deep ● Deep

WHAT THE FOUR STAGES MEAN

NEVER USED

Holds a seat, produced nothing.

ACTIVE, NOT HABITUAL

Used it, but under 3 of the last 4 weeks.

HABITUAL, NOT DEEP

Most weeks, but under 10% delegated.

DEEP

Most weeks and over 10% delegated.

NEVER USED | 164 seats produced nothing, costing \$36,981. Reclaim before buying more.

ACTIVE, NOT HABITUAL | 346 use it occasionally. The cheapest cohort to move.

HABITUAL, NOT DEEP | 688 have the habit but do not delegate. Worth 126.6 FTE.

DEEP | 202 are worth 37.2 FTE. What they do differently is the playbook for the other 1,198.

DELEGATION RATE

WHAT PEOPLE ACTUALLY DO share of interactions by surface type

Suggest Edit Review Delegate

DELEGATION RATE OVER TIME

DOES DELEGATING MEAN ACCEPTING WORSE CODE?

People who delegate real work accept 36.4% of the completions they are shown, against 32.1% for everyone else — a 4.3% gap in their favour. Depth is not coming at the cost of care.

WHAT DEEP USERS DO THAT OTHERS DO NOT

198 people have used the CLI. Almost all of them are deep users, and almost no one else has touched it — which makes it the clearest single thing to teach someone who already has the habit.

Depth costs more, and that is expected

DELEGATION RATE BY STACK where whole tasks are trusted most

STACK DETAIL where the delegated work actually lands

Stack	Interactions	Delegation rate
python	750,469	8.3%
typescript	524,605	8.0%
csharp	311,959	9.0%
others	302,584	8.1%
markdown	147,917	3.7%
javascript	45,653	8.1%
yaml	32,963	6.9%
go	25,824	12.6%
...	...	...

WHAT THE STACKS SAY

python carries the most work at 34.2% of attributed interactions. go delegates the most at 12.6%, against 8.0% overall - so the stack people trust with whole tasks is not the one they use most.

What that depth is worth

Deep users produce more. That difference, times a headcount, is the whole value model.

Organisation	Active Users	Deep Users	Delegation Rate	Capacity Gained (FTE)	Value Realised	Cost per Deep User
Amara Kelleher	96	20	10.4%	3.7 FTE	\$265,966	\$17,884
Amara Lagerlof	42		0.6%			
Anders Delgado	56	19	16.4%	3.5 FTE	\$252,668	\$18,826
Anders Farouk	98	42	16.4%	7.7 FTE	\$558,528	\$8,516
Emeka Rossetti	125	32	13.4%	5.9 FTE	\$425,545	\$11,178
Felix Havelock	99	13	10.3%	2.4 FTE	\$172,878	\$27,515
Idris Adeyemi	125	11	7.5%	2.0 FTE	\$146,281	\$22,517

VALUE NARRATIVE

202 deep users x 18.4% more PRs merged per week = 37.2 FTE, worth \$2,686,255 over 5.8 months against \$357,690 invested. The uplift is the only behavioural assumption here.

DEFINITIONS

Delegation rate = interactions in agent, CLI, plan and app surfaces, divided by all interactions. Deep user = personal delegation rate above 10%. Habitual = active in 3 of the last 4 weeks. All three are counts.

METRIC GLOSSARY every number on this report, and whether it is counted or assumed

Group	Metric	What it means	How it is derived
1 Reach	Activation	Share of seats that produced any activity.	Active users / licensed users
1 Reach	Active users	Used Copilot at least once in the period.	Distinct people with any suggestion or
1 Reach	Agent adoption (GitHub)	GitHub's own flag for people who have adopted agents.	Distinct people flagged / active users
1 Reach	Habit conversion	How many of those who tried it kept going.	Habitual / active users
1 Reach	Habitual users	Uses it as part of the working week, not occasionally.	Active in 3 of the trailing 4 weeks
1 Reach	Licensed users	Everyone holding a seat in the period.	Distinct people in the extract
1 Reach	Produced nothing	Seats that generated no activity at all.	Licensed - active users
2 Depth	Deep users	People who delegate rather than only autocomplete.	Own delegation rate above 10%
2 Depth	Delegated interactions	Actions where a whole task is handed over, not a suggestion accepted.	Interactions in agent, CLI, plan and app
2 Depth	Delegation rate	How much of what people do is real delegation.	Delegated / all interactions
2 Depth	Depth conversion	Of those with the habit, how many got deep.	Deep / habitual users
2 Depth	Habit but not deep	The population a depth programme would target.	Habitual - deep users
2 Depth	Interactions	Every recorded Copilot action.	Sum of usage across all surfaces
2 Depth	Our deep user share	Deep users as a share of active, so it is comparable with GitHub's flag.	Deep users / active users
3 Value	Capacity gained	Extra output from deep users, expressed as headcount.	Deep users x uplift
3 Value	Deep user uplift	How much more a deep user produces than a matched peer.	Customer input - the ONE behavioural
3 Value	Idle seat cost	Paid for seats that produced nothing.	Produced nothing x seat cost x months
3 Value	Investment	What has been spent in the period shown.	Seats x seat cost x months + enablemei
3 Value	Net value	Value realised less investment.	Value realised - investment
3 Value	ROI	Return on the period's spend.	Net value / investment
3 Value	Still on the table	The prize for moving people who already have the habit.	(Habitual - deep) x uplift
3 Value	Value realised	That capacity in money, for the period shown.	Capacity x loaded annual cost x months
4 Quality	Completion acceptance	Share of offered code completions the developer kept.	Accepted / suggested completions

CAVEATS

This is observational. Where delegation and output move together that is an association, not a proven cause. Compare adopted against not-yet-adopted teams over the same window rather than before against after.

Capacity valued at a loaded annual cost values time released, not value created. A mature model moves toward cycle time, change failure rate and review latency — none of which are in this extract.

Credit, token and billing consumption are excluded. This dataset does not carry them and inferring spend from usage would be a guess.

Which surfaces count as delegation is a judgement. It is held as data in the Feature table, so it can be argued with and changed without touching a measure.
